

ABSTRACT OF THE DISCLOSURE

A software quality control system has a control terminal provided to an administrator, information terminals provide at each work location, an information processor, a storage apparatus for storage of data, and the Internet, which connects the information terminals and the information processor. The information terminals access the information processor via the Internet, and perform storage of quality data. The information processor stores input quality data in the storage apparatus 3 and, in response to a request from an information terminal, performs such operations as searching and analysis of quality data stored in the storage apparatus.
